## MDR Genesis Order File

### I. SOURCE:

The source system is the Cerner Millenium. All records are based on records sent from WH\_CLN\_ORDER file. In order to increase the utility of this file, it is merged against other tables from Cerner Millenium [as well as other files on the MDR, as described below in Section VI.]

### II. TRANSMISSION (FORMAT AND FREQUENCY)

TBD

### III. ORGANIZATION AND BATCHING

Source data: The first step in MDR processing is to batch records received from MHS Genesis. Raw data batches are stored in /mdr/genesis/raw according to routine MDR operating procedures.

Output products: SAS datasets containing all order records where the order\_dt\_tm is in a fiscal year. The Order files are stored at /mdr/pub/genesis/orders/fyxx.sas7bdat

### IV. RECEIVING FILTERS

All records were provided with the initial batch of data. Thereafter, new and changed records are sent each week.

### V. UPDATE PROCESS

The primary key for the Order table is the ORDER\_SK field. During the extraction of the raw order records, de-duplication of records, or anytime an order key collision occurs between incoming data and existing master data, the processor de-duplicates data by selecting the record with the most recent value of the update date/time (UPDT\_DT\_TM) for any multiple of records with the same primary key. Similar update processes are applied to the other raw data sets.

Once the raw data has been updated, the processor combines them as described here and assigns many other internally-derived variables as described in Table 2.

### VI. FIELD TRANSFORMATIONS AND DELETIONS FOR MDR CORE DATABASE

This section of this functional specification describes the data merges that are necessary to append fields in the MDR Genesis Order file. Table 1 describes additional files that are used in processing.

Merge	Date Matching	Additional Matching
Code Value Outbound Reference		health_system_source_id = 18635 and active_ind = 1
Order Detail		order_sk where order_sk not in ('0', '') and orderable_detail_sk in ('12615','633581','663838','73801613','114199829','23357379','23357394','23357396','23357412','115487725','115487915','291366787','397808379') and health_system_id=18635 keep the record for an orderable_detail_sk for an order_sk with the most recent upd_dt_tm and the highest action_sequence

Merge	Date Matching	Additional Matching
Order Action		order_sk where action_sequence=1 and action_type_ref= 'Order' and order_status_ref='Completed'
Charges File		order_sk
Encounter History		encounter_nk Table manipulated to find initial and ending transaction_dt_tm for a location record associated with an encounter_nk
MDR Genesis Person File		person_sk
MDR Genesis Location File		order_loc_o=location_sk order_loc_od=location_sk order_loc_ref_oa=location_sk order_loc_charges=location_sk loc_code_enc_adm=location_sk enc_loc_eh=location_sk loc_code_enc=location_sk
MDR Genesis Personnel File		order_doc_prsnl=person_sk order_prov_od=person_sk order_prov_oa=person_sk super_prsnl_oa=person_sk order_prov_charges=person_sk
MDR GENESIS Encounter File	order_dt=visit_dt (merge 1 on encounter file where earliest visit_dt_tm records for an encounter is kept (referred to as the Encounter Admission, or enc_adm file), merge 2 on encounter file with all visit_dts associated with an encounter_nk)	encounter_nk

Upon matching to the MDR Genesis Person file, MDR Genesis Personnel file, and MDR Genesis Location file, records that meet the following criteria are deleted:

- Records where the test\_person\_ind is 1 in the MDR Genesis Person File.
- Records with a facility display beginning with "MB".

Business rules for each of the appended fields are described in the body of the format table in Section VII.

## VII. FILE LAYOUT

The MDR Genesis Orders file is stored in a SAS data set. Table 2 provides the file layout and processing rules.
